# Package 'Manifoldgstat'

March 22, 2019

Type Package

Version 1.0.0

Title Kriging prediction for manifold-valued data.

Description Inference and prediction for manifold-valued data analysis. This package provides a C++ implementation of the functions to create a model, for spatial dependent manifold valued data, in order to perform kriging.  In each location, specified by a vector of coordinates ([lat,long], [x,y] or [x,y,z]), the datum is supposed to be a symmetric and positive definite matrix (possibly a correlation matrix). The algorithm exploits a projection of these data on a tangent space, where the tangent point is either provided by the user or computed as intrinsic mean of the
data in input.
<b>Depends</b> R (>= 3.2.0), Rcpp (>= 0.12.16), RcppEigen (>= 0.3.3.4.0), plyr(>= 1.8.4)

bootstrapVar distance_manifold full_RDD intrinsic_mean kriging mixed_RDD model_GLS model_kriging  1  Index

2 distance\_manifold

	b	ootstrapVar	Compute the bootstrap variance
--	---	-------------	--------------------------------

## **Description**

Compute the bootstrap variance

## Usage

```
bootstrapVar(res.boot, res.aggr, K, metric_manifold)
```

### **Arguments**

res.boot A list of length B. Each field contains the predictions for the corresponding iter-

ation

res.aggr A list as long as the number of the prediction. Each field a single prediction

K number of neighbourhood used in the analysis

metric\_manifold

metric used on the manifold. It must be chosen among "Frobenius", "LogEu-

clidean", "SquareRoot"

#### Value

It returns a vector, as long as the number of predictions, containing the the variance at the predicted locations

# Description

Compute the manifold distance between symmetric positive definite matrices

### Usage

```
distance_manifold(data1, data2, metric_manifold = "Frobenius")
```

# Arguments

data1 list or array [p,p,B1] of B1 symmetric positive definite matrices of dimension

p\*p. Or a single p\*p matrix

data2 list or array [p,p,B2] of B2 symmetric positive definite matrices of dimension

p\*p. Or a single p\*p matrix.

metric\_manifold

metric used on the manifold. It must be chosen among "Frobenius", "LogEu-

clidean", "SquareRoot", "Correlation"

full\_RDD 3

#### **Details**

If B2=B1 then the result is a vector of length B1=B2 containing in position i the manifold distance beetween data1[,,i] and data2[,,i]. Instead if B2=1 and B1!=1 the result is a vector of length B1 containing in position i the manifold distance between data1[,,i] and data2[,,1]

### Value

A double or a vector of distances

### **Examples**

```
data_manifold_model <- Manifoldgstat::rCov
distances <-distance_manifold(data_manifold_model, diag(2), metric_manifold = "Frobenius")
print(distances)</pre>
```

full\_RDD

Perform full\_RDD

## **Description**

Perform full\_RDD

## Usage

```
full_RDD(data_coords, data_val, K, grid, nk_min = 1, B = 100,
   suppressMes = F, tol = 1e-12, max_it = 100, n_h = 15,
   tolerance_intrinsic = 10^(-6), X = NULL, X_new = NULL,
   ker.width.intrinsic = 0, ker.width.vario = 1.5,
   graph.distance.complete, data.grid.distance, N_samples, p,
   aggregation_mean, aggregation_kriging, method.analysis = "Local mean",
   metric_manifold, metric_ts, model_ts, vario_model, distance = NULL)
```

## **Arguments**

data_coords	N*2 or N*3 matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees			
data_val	array [p,p,N] of N symmetric positive definite matrices of dimension p*p			
K	number of neighborhood (i.e., centers) to sample at each iteration			
grid	prediction grid			
nk_min	minimum number of observations within a neighborhood			
В	number of divide iterations to perform			
suppressMes	{TRUE, FALSE} controls the level of interaction and warnings given			
tol	tolerance for the main loop of model_kriging			
max_it	maximum number of iterations for the main loop of model_kriging			
n_h	number of bins in the empirical variogram			
tolerance_intrinsic				
	tolerance for the computation of the intrinsic mean. Not needed if Sigma is provided			

4 full\_RDD

X matrix (N rows and unrestricted number of columns) of additional covariates for the tangent space model, possibly NULL

X\_new matrix (with the same number of rows of new\_coords) of additional covariates for the new locations, possibly NULL

ker.width.intrinsic

parameter controlling the width of the Gaussian kernel for the computation of the local mean (if 0, no kernel is used)

ker.width.vario

parameter controlling the width of the Gaussian kernel for the computation of the empirical variogram (if 0, no kernel is used)

graph.distance.complete

N\*N distance matrix (the [i,j] element is the length of the shortest path between points i and j)

data.grid.distance

N\*dim(grid)[1] distance matrix between locations where the datum has been observed and locations where the datum has to be predicted

N\_samples number of samples

p dimension of the manifold matrices

aggregation\_mean

"Weighted" if the prediction obtained using the intrinsic mean, must be aggregated using different weights, "Equal" to use equal weights

aggregation\_kriging

"Weighted" if the prediction obtained using Kriging, must be aggregated using different weights, "Equal" to use equal weights

method.analysis

"Local mean" to predict just with the mean, "Kriging" to predict via Kriging procedure

metric\_manifold

metric used on the manifold. It must be chosen among "Frobenius", "LogEuclidean", "SquareRoot"

metric\_ts metric used on the tangent space. It must be chosen among "Frobenius", "Frobenius Scaled", "Correlation"

model\_ts type of model fitted on the tangent space. It must be chosen among "Intercept", "Coord1", "Coord2", "Additive"

vario\_model type of variogram fitted. It must be chosen among "Gaussian", "Spherical",

"Exponential"

distance type of distance between coordinates. It must be either "Eucldist" or "Geodist"

# Value

According to the analysis chosen:

- If method. analysis = "Local mean" it returns a list with the following fields
  - resBootstrap On its turn it is a list consisting of
    - \* fmean It is a list with length B. Each field contains, for each new location, its prediction (at iteration b) obtained as intrinsic mean of the data inside the tile it belongs to
    - \* kervalues\_mean Weights used for aggregating fmean

intrinsic\_mean 5

 resAggregatedPredictions, for each new location, obtained aggregating fmean using kervalues\_mean as weights

- If method.analysis = "Kriging" it returns a list with the following fields
  - resBootstrap On its turn it is a list consisting of
    - \* fmean It is a list with length B. Each field contains, for each new location, its prediction (at iteration b) obtained as intrinsic mean of the data inside the tile it belongs to
    - \* fpred It is a list with length B. Each field contains, for each new location, the prediction (at iteration b) obtained using Kriging
    - \* kervalues\_mean Weights used for aggregating fmean
    - \* kervalues\_krig Weights used for aggregating fpred
    - \* variofit It is a list with length B. Each field contains, for each tile, the parameters of the fitted variogram
  - resAggregated Predictions, for each new location, obtained aggregating fpred using kervalues\_krig as weights
  - resLocalMean Predictions, for each new location, obtained aggregating fmean using kervalues\_mean as weights

intrinsic\_mean

Intrinsic mean

### **Description**

Evaluate the intrinsic mean of a given set of symmetric positive definite matrices

# Usage

```
intrinsic_mean(data, metric_manifold = "Frobenius",
  metric_ts = "Frobenius", tolerance = 1e-06,
  weight_intrinsic = NULL, weight_extrinsic = weight_intrinsic,
  tolerance_map_cor = 1e-06)
```

## **Arguments**

data p,p,B of B symmetric positive definite matrices of dimension p\*p metric\_manifold

metric used on the manifold. It must be chosen among "Frobenius", "LogEuclidean", "SquareRoot", "Correlation"

metric\_ts metric used on the tangent space. It must be chosen among "Frobenius", "Frobenius Scaled", "Correlation"

tolerance tolerance for the computation of the intrinsic\_mean weight\_intrinsic

vector of length B to weight the matrices in the computation of the intrinsic mean. If NULL a vector of ones is used

weight\_extrinsic

vector of length B to weight the matrices in the computation of the extrinsic mean. If NULL weight\_intrinsic are used

tolerance\_map\_cor

tolerance to use in the maps.
Required only if metric\_manifold== "Correlation"

6 kriging

### Value

A matrix representing the intrinsic mean of the data

# **Examples**

kriging

Kriging prediction given the model

# Description

Given the GLS model kriging prediction on new location is performed.

# Usage

```
kriging(GLS_model, coords, new_coords, model_ts = "Additive",
  vario_model = "Gaussian", metric_manifold = "Frobenius",
  X_new = NULL, distance = "Geodist", tolerance_map_cor = 1e-06)
```

# Arguments

GLS_model	the object returned by model_GLS, or a list containing the fields: Sigma (tangent point), beta (vector of the beta matrices of the fitted model), gamma_matrix (N*N covariogram matrix), residuals (vector of the N residual matrices), fitted_par_vario (estimates of <i>nugget</i> , <i>sill-nugget</i> and <i>practical range</i> )	
coords	N*2 or $N*3$ matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees	
new_coords	matrix of coordinates for the new locations where to perform kriging	
model_ts	type of model fitted on the tangent space. It must be chosen among "Intercept", "Coord1", "Coord2", "Additive"	
vario_model	type of variogram fitted. It must be chosen among "Gaussian", "Spherical", "Exponential"	
metric_manifold		
	metric used on the manifold. It must be chosen among "Frobenius", "LogEuclidean", "SquareRoot", "Correlation"	
X_new	matrix (with the same number of rows of new_coords) of additional covariates for the new locations, possibly NULL	
distance	type of distance between coordinates. It must be either "Eucldist" or "Geodist"	
tolerance_map_cor		
	tolerance to use in the maps.	
	Required only if metric_manifold=="Correlation"	
data_grid_dist_mat		
	Matrix of dimension N*M of distances between data points and grid points. If not	

provided it is computed using distance

kriging 7

#### **Details**

The model provided is used to perform simple kriging on the tangent space in correspondence of the new locations. The estimates are then mapped to the manifold to produce the actual prediction.

#### Value

A list with a single field:

prediction

vector of matrices predicted at the new locations

#### References

    data.grid.distance, N_samples, p, aggregation_mean, metric_ts,
    tol = 1e-12, max_it = 100, n_h = 15,
    tolerance_intrinsic = 10^(-6), X = NULL, X_new = NULL,
    create_pdf_vario = FALSE, pdf_parameters = NULL, metric_manifold,
    model_ts, vario_model, distance)
```

# Arguments

data\_coords N\*2 or N\*3 matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees array [p,p,N] of N symmetric positive definite matrices of dimension p\*p data\_val number of neighborhood (i.e., centers) to sample at each iteration grid prediction grid nk\_min minimum number of observations within a neighborhood number of \texitdivide iterations to perform {TRUE, FALSE} controls the level of interaction and warnings given suppressMes ker.width.intrinsic parameter controlling the width of the Gaussian kernel for the computation of the local mean (if 0, no kernel is used) graph.distance.complete N\*N distance matrix (the [i,j] element is the length of the shortest path between points i and j) data.grid.distance

N\*dim(grid)[1] distance matrix between locations where the datum has been observed and locations where

model\_GLS 9

N\_samples number of samples

p dimension of the manifold matrices

aggregation\_mean

"Weighted" if the prediction obtained using the intrinsic mean, must be aggre-

gated using different weights, "Equal" to use equal weights

metric\_ts metric used on the tangent space. It must be chosen among "Frobenius", "Frobe-

niusScaled", "Correlation"

tol tolerance for the main loop of model\_kriging

max\_it maximum number of iterations for the main loop of model\_kriging

n\_h number of bins in the empirical variogram

tolerance\_intrinsic

tolerance for the computation of the intrinsic mean. Not needed if Sigma is

provided

X matrix (N rows and unrestricted number of columns) of additional covariates for

the tangent space model, possibly NULL

X\_new matrix (with the same number of rows of new\_coords) of additional covariates

for the new locations, possibly NULL

create\_pdf\_vario

boolean. If TRUE the empirical and fitted variograms are plotted in a pdf file

 $\verb|pdf_parameters| list with the fields test_nr and sample_draw. Additional parameters to name$ 

the pdf

metric\_manifold

metric used on the manifold. It must be chosen among "Frobenius", "LogEu-

clidean", "SquareRoot"

model\_ts type of model fitted on the tangent space. It must be chosen among "Intercept",

"Coord1", "Coord2", "Additive"

vario\_model type of variogram fitted. It must be chosen among "Gaussian", "Spherical",

"Exponential"

distance type of distance between coordinates. It must be either "Eucldist" or "Geodist"

## Value

it returns a list with the following fields

- resBootstrap...
- resAggregated...
- model\_pred...

model\_GLS

Create a GLS model

## **Description**

Given the coordinates and corresponding manifold values, this function creates a GLS model on the tangent space.

10 model\_GLS

#### **Usage**

```
model_GLS(data_manifold, coords, X = NULL, Sigma = NULL,
 metric_manifold = "Frobenius", metric_ts = "Frobenius",
 model_ts = "Additive", vario_model = "Gaussian", n_h = 15,
 distance = "Geodist", max_it = 100, tolerance = 1e-06,
 weight_intrinsic = NULL, tolerance_intrinsic = 1e-06,
 max_sill = NULL, max_a = NULL, param_weighted_vario = NULL,
 plot = FALSE, suppressMes = FALSE, weight_extrinsic = NULL,
  tolerance_map_cor = 1e-06)
```

## **Arguments**

data\_manifold list or array [p,p,N] of N symmetric positive definite matrices of dimension p\*p coords N\*2 or N\*3 matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees Χ matrix (N rows and unrestricted number of columns) of additional covariates for the tangent space model, possibly NULL Sigma p\*p matrix representing the tangent point. If NULL the tangent point is computed as the intrinsic mean of data\_manifold metric\_manifold metric used on the manifold. It must be chosen among "Frobenius", "LogEuclidean", "SquareRoot", "Correlation" metric\_ts metric used on the tangent space. It must be chosen among "Frobenius", "FrobeniusScaled", "Correlation" model\_ts type of model fitted on the tangent space. It must be chosen among "Intercept", "Coord1", "Coord2", "Additive" vario\_model type of variogram fitted. It must be chosen among "Gaussian", "Spherical", "Exponential" number of bins in the emprical variogram  $n_h$ distance type of distance between coordinates. It must be either "Eucldist" or "Geodist" max\_it max number of iterations for the main loop tolerance tolerance for the main loop weight\_intrinsic

vector of length N to weight the locations in the computation of the intrinsic mean. If NULL a vector of ones is used. Not needed if Sigma is provided

tolerance\_intrinsic

tolerance for the computation of the intrinsic mean. Not needed if Sigma is provided

max\_sill max value allowed for sill in the fitted variogram. If NULL it is defined as 1.15\*max(emp\_vario\_values)

maximum value for a in the fitted variogram. If NULL it is defined as 1.15\*h\_max max a param\_weighted\_vario

> List of 7 elements to be provided to consider Kernel weights for the variogram: weight\_vario (vector of length N\_tot to weight the locations in the computation of the empirical variogram), distance\_matrix\_tot (N\_tot\*N\_tot matrix of distances between the locations), data\_manifold\_tot (list or array [p,p,N\_tot] of N\_tot symmetric positive definite matrices of dimension p\*p),

model\_GLS 11

coords\_tot (N\_tot\*2 or N\_tot\*3 matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees), X\_tot (matrix with N\_tot rows and unrestricted number of columns, of additional covariates for the tangent space model. Possibly NULL), h\_max (maximum value of distance for which the variogram is computed) indexes\_model (indexes corresponding to coords in coords\_tot).

Required only in the case metric\_manifold = "Correlation"

plot boolean. If TRUE the empirical and fitted variograms are plotted

suppressMes boolean. If TRUE warning messagges are not printed

weight\_extrinsic

vector of length N to weight the locations in the computation of the extrinsic mean. If NULL weight\_intrinsic are used. Needed only if Sigma is not provided and metric\_manifold== "Correlation"

tolerance\_map\_cor

tolerance to use in the maps.

Required only if metric\_manifold== "Correlation"

computed using distance

#### **Details**

The manifold values are mapped on the tangent space and then a GLS model is fitted to them. A first estimate of the beta coefficients is obtained assuming spatially uncorrelated errors. Then, in the main the loop, new estimates of the beta are obtained as a result of a weighted least square problem where the weight matrix is the inverse of gamma\_matrix. The residuals

(residuals = data\_ts - fitted) are updated accordingly. The parameters of the variogram fitted to the residuals (and used in the evaluation of the gamma\_matrix) are computed using Gauss-Newton with backtrack method to solve the associated non-linear least square problem. The stopping criteria is based on the absolute value of the variogram residuals' norm if ker.width.vario=0, while it is based on its increment otherwise.

## Value

A list with the following fields:

beta vector of the beta matrices of the fitted model

gamma\_matrix N\*N covariogram matrix

residuals vector of the N residual matrices

emp\_vario\_values

vector of empircal variogram values in correspondence of h\_vec

h\_vec vector of positions at which the empirical variogram is computed

fitted\_par\_vario

estimates of nugget, sill-nugget and practical range

iterations number of iterations of the main loop

Sigma tangent point

#### **Examples**

model\_kriging

Create a GLS model and directly perform kriging

## **Description**

Given the coordinates and corresponding manifold values, this function firstly creates a GLS model on the tangent space, and then it performs kriging on the new locations.

## Usage

```
model_kriging(data_manifold, coords, X = NULL, Sigma = NULL,
    metric_manifold = "Frobenius", metric_ts = "Frobenius",
    model_ts = "Additive", vario_model = "Gaussian", n_h = 15,
    distance = NULL, data_dist_mat = NULL, data_grid_dist_mat = NULL,
    max_it = 100, tolerance = 1e-06, weight_intrinsic = NULL,
    tolerance_intrinsic = 1e-06, max_sill = NULL, max_a = NULL,
    param_weighted_vario = NULL, new_coords, X_new = NULL,
    create_pdf_vario = TRUE, pdf_parameters = NULL,
    suppressMes = FALSE, weight_extrinsic = NULL,
    tolerance_map_cor = 1e-06)
```

# **Arguments**

	data_manifold	list or array $[p,p,N]$ of N symmetric positive definite matrices of dimension $p*p$	
	coords	N*2 or $N*3$ matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees	
	X	matrix (N rows and unrestricted number of columns) of additional covariates for the tangent space model, possibly NULL	
	Sigma	$p*p$ matrix representing the tangent point. If NULL the tangent point is computed as the intrinsic mean of data_manifold	
metric_manifold			
		metric used on the manifold. It must be chosen among "Frobenius", "LogEuclidean", "SquareRoot", "Correlation"	
	metric_ts	metric used on the tangent space. It must be chosen among "Frobenius", "FrobeniusScaled", "Correlation"	
	model_ts	type of model fitted on the tangent space. It must be chosen among "Intercept", "Coord1", "Coord2", "Additive"	
	vario_model	type of variogram fitted. It must be chosen among "Gaussian", "Spherical", "Exponential"	
	n_h	number of bins in the emprical variogram	

distance type of distance between coordinates. It must be either "Eucldist" or "Geodist"

data\_dist\_mat Matrix of dimension N\*N of distances between data points. If not provided it is

computed using distance

data\_grid\_dist\_mat

Matrix of dimension N\*M of distances between data points and grid points. If not

provided it is computed using distance

max\_it max number of iterations for the main loop

tolerance tolerance for the main loop

weight\_intrinsic

vector of length N to weight the locations in the computation of the intrinsic mean. If NULL a vector of ones is used. Not needed if Sigma is provided

tolerance\_intrinsic

tolerance for the computation of the intrinsic mean. Not needed if Sigma is

provided

 $\max\_sill$  max value allowed for sill in the fitted variogram. If NULL it is defined as

1.15\*max(emp\_vario\_values)

max\_a maximum value for a in the fitted variogram. If NULL it is defined as 1.15\*h\_max

param\_weighted\_vario

List of 7 elements to be provided to consider Kernel weights for the variogram: weight\_vario (vector of length N\_tot to weight the locations in the computation of the empirical variogram), distance\_matrix\_tot (N\_tot\*N\_tot matrix of distances between the locations), data\_manifold\_tot (list or array

[p,p,N\_tot] of N\_tot symmetric positive definite matrices of dimension p\*p, coords\_tot (N\_tot\*2 or N\_tot\*3 matrix of [lat,long], [x,y] or [x,y,z] coordinates. [lat,long] are supposed to be provided in signed decimal degrees), X\_tot (matrix with N\_tot rows and unrestricted number of columns, of additional covariates for the tangent space model. Possibly NULL), indexes\_model (indexes corresponding to coords in coords\_tot)

new\_coords matrix of coordinates for the new locations where to perform kriging

X\_new matrix (with the same number of rows of new\_coords) of additional covariates

for the new locations, possibly NULL

create\_pdf\_vario

boolean. If TRUE the empirical and fitted variograms are plotted in a pdf file

pdf\_parameters list with the fields test\_nr and sample\_draw. Additional parameters to name

the pdf

suppressMes boolean. If TRUE warning messagges are not printed

weight\_extrinsic

vector of length N to weight the locations in the computation of the extrinsic mean. If NULL weight\_intrinsic are used. Needed only if Sigma is not provided and metric\_manifold== "Correlation"

tolerance\_map\_cor

tolerance to use in the maps.

Required only if metric\_manifold== "Correlation"

# **Details**

The manifold values are mapped on the tangent space and then a GLS model is fitted to them. A first estimate of the beta coefficients is obtained assuming spatially uncorrelated errors. Then, in the main the loop, new estimates of the beta are obtained as a result of a weighted least square problem

where the weight matrix is the inverse of gamma\_matrix. The residuals

(residuals = data\_ts - fitted) are updated accordingly. The parameters of the variogram fitted to the residuals (and used in the evaluation of the gamma\_matrix) are computed using Gauss-Newton with backtrack method to solve the associated non-linear least square problem. The stopping criteria is based on the absolute value of the variogram residuals' norm if ker.width.vario=0, while it is based on its increment otherwise. Once the model is computed, simple kriging on the tangent space is performed in correspondence of the new locations and eventually the estimates are mapped to the manifold.

### Value

list with the following fields:

beta vector of the beta matrices of the fitted model

gamma\_matrix N\*N covariogram matrix

residuals vector of the N residual matrices

emp\_vario\_values

vector of empircal variogram values in correspondence of h\_vec

h\_vec vector of positions at which the empirical variogram is computed

fitted\_par\_vario

estimates of nugget, sill-nugget and practical range

iterations number of iterations of the main loop

Sigma tangent point

prediction vector of matrices predicted at the new locations
